

Life

We exist within a period of time defined by our awareness of death. With a beginning and an end. What comes in between, is often defined as life. Understanding our own death is a period of time with no definition. This catches us within a complex process of thought – with no experience of what comes after death, only illusory ideas and speculations. We oscillate. Between internal and external. Between the known and unknown. Between life and post-death. Sense or non-sense. Meaning or no meaning. The sense of the world flows through us. We become aware of the world. We cannot impose our sense making on the world. Through this we enter into a continual state of being and becoming. Our fragmentary understanding of the world formulates through experiences of varying intensity. We act and intervene: through impulse, meditation, habit, invention, which result in physical and non-physical results, with one often resulting in the other. Those in the present, in dialogue with the past. The past created, altered by the present. A continual interplay. Life. As experience and knowledge expands, boundaries form, blur, dissolve. Orientations shift and fix, fix and shift, forming and unforming. Ripples, generated as we become aware of a conception, continue after death. Ripples that alter life itself. Disruption of a flow of directional energy, manifested in our lived, and un-lived-in, environments, each having an impact on the other. Defined and undefined. The world and the universe exist as protagonists within this set of fluid relationships, orbiting and pulsating. Existence seen in this way is one of constant change with focus and truth punctuating our human lens, cutting through sense. Seen from the interstellar, the global, local and personal. The past and the present continue to converge within this text and the written word in general. Part of and containing an evolving relationship with the self and the other. As writing is transformed through reading by the other. Indeed the words on the page themselves are imbued with the current scientific knowledge that atoms exist within an incessant state of vibration, as scientific knowledge tells us - and life presents itself to us, continually, if we allow it to.
